Negation introduction

Negation elimination

How do we use a negation in a proof?

¬-elimination

$$\parallel \parallel$$

(k) P

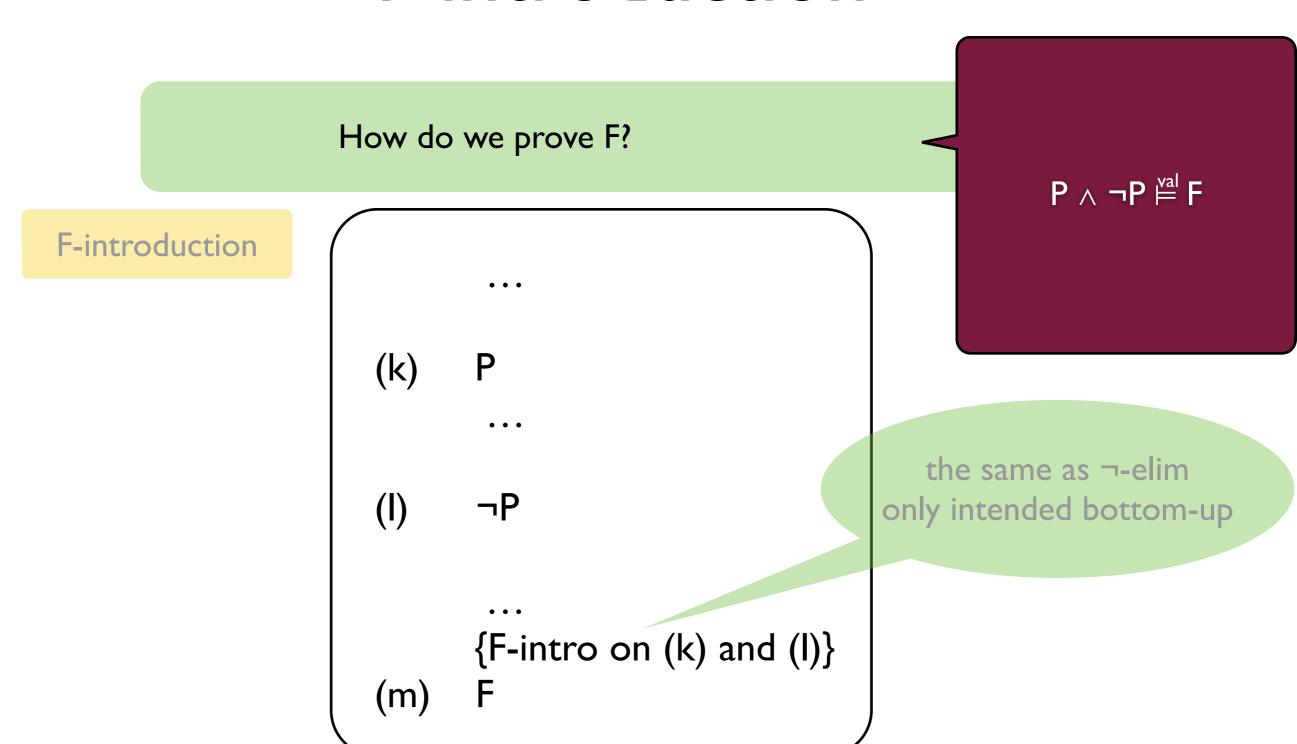

(I) ¬P

 $(k \le m, l \le m)$

 $P \wedge \neg P \stackrel{\text{val}}{\models} F$

time for an example!

F introduction

(k < m, l < m)

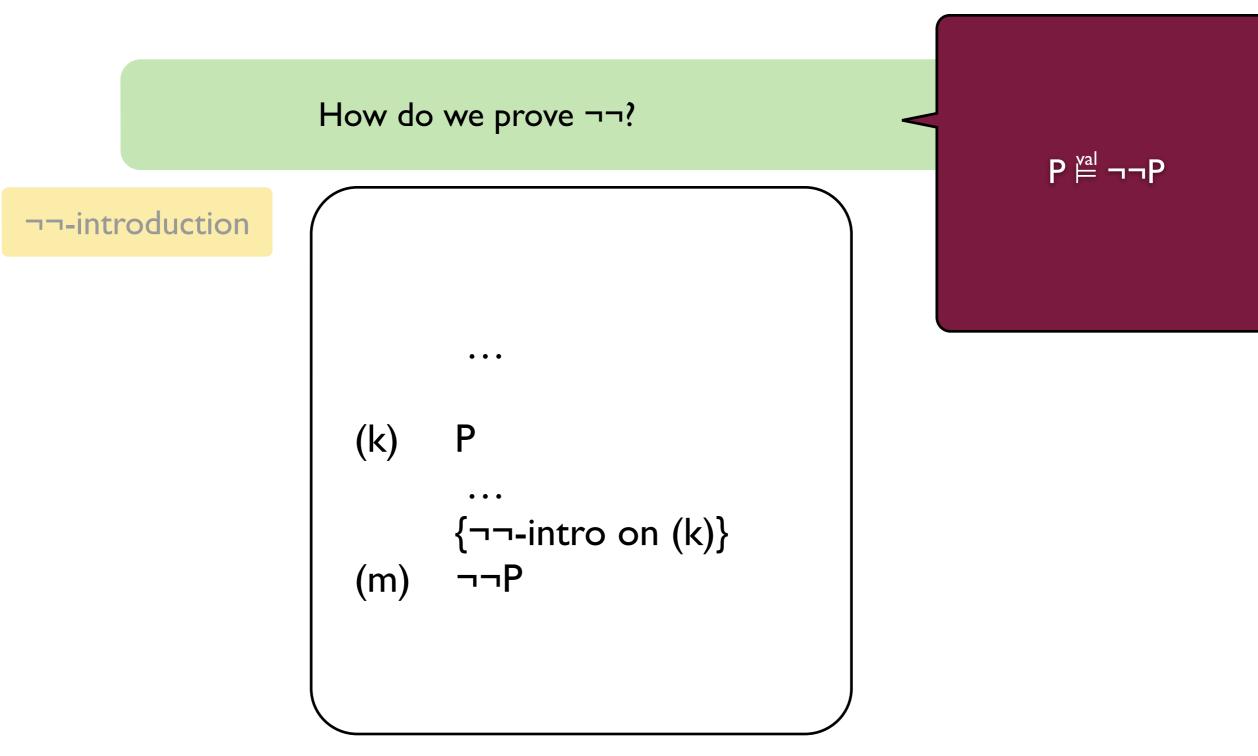

F elimination

How do we use F in a proof? F-elimination (k) $\{F-elim on (k)\}$ (m)

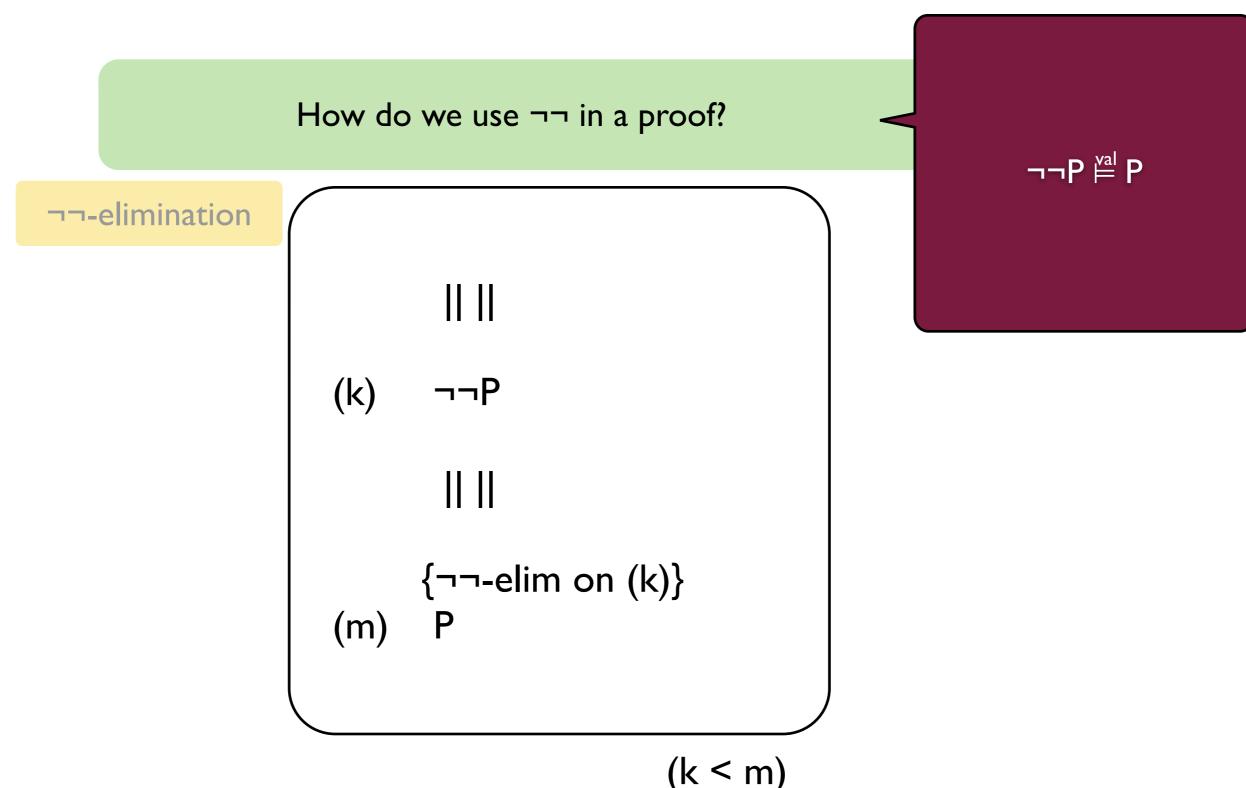

it's very useful!

 $F \stackrel{\text{val}}{\models} P$

Double negation introduction

Double negation elimination

Proof by contradiction

Theorem

If x^2 is even, then x is even $(x \in \mathbb{Z})$.

Proof

Assume x^2 is even.

Assume that x is odd.

Then x = 2y+1 for some $y \in \mathbb{Z}$.

Then
$$x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$$
 and $2y^2 + 2y \in \mathbb{Z}$.

So, x^2 is odd

a contradiction.

So, x is even

(sub)goal

generating hypothesis

pure hypothesis

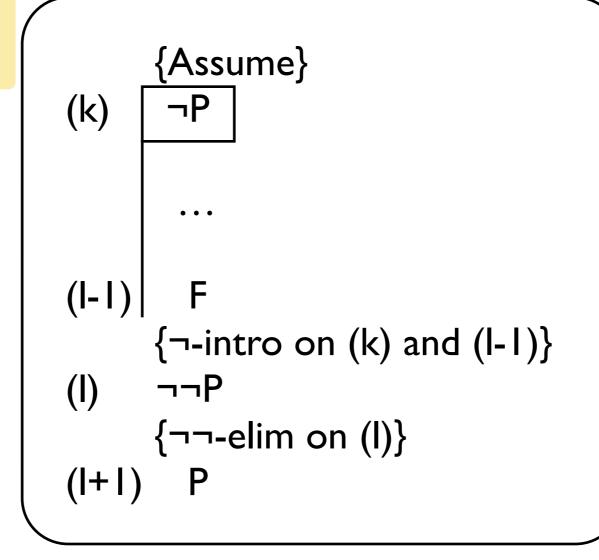

conclusion

Bi-implication elimination

Derivations / Reasoning with quantifiers

Proving a universal quantification

To prove

$$\forall x[x \in \mathbb{Z} \land x \ge 2 : x^2 - 2x \ge 0]$$

Proof

Let $x \in \mathbb{Z}$ be arbitrary and assume that $x \ge 2$.

Then, for this particular x, it holds that $x^2 - 2x = x(x-2) \ge 0$ (Why?)

Conclusion: $\forall x[x \in \mathbb{Z} \land x \ge 2 : x^2 - 2x \ge 0].$

∀ introduction

How do we prove a universal quantification? -

⇒-intro

similar to

with

generating hypothesis

∀-introduction

(k) var x; P(x)

(I-I) Q(x)
{∀-intro on (k) and (I-I)}
(I) ∀x[P(x):Q(x)]

shows the validity of a hypothesis

Using a universal quantification

We know

 $\forall x[x \in \mathbb{Z} \land x \ge 2 : x^2 - 2x \ge 0]$

Whenever we encounter an $a \in \mathbb{Z}$ such that $a \ge 2$, we can conclude that $a^2 - 2a \ge 0$.

For example, $(52387^2 - 2 \cdot 52387) \ge 0$ since $52387 \in \mathbb{Z}$ and $52387 \ge 2$.

∀ elimination

How do we use a universal quantification in a proof?

∀-elimination

(k) $\forall x[P(x):Q(x)]$

|| ||

(I) P(a)

| II | I| {∀-elim on (k) and (l)} (m) Q(a)

Q(a)

similar to implication but we need a witness

a is
an object
(variable, number,..)
which is "known" in line
(l)

the same "a" from line (I)

time for an example!

(k < m, l < m)

3 introduction

How do we prove an existential quantification?

3-introduction

```
{Assume}
        \forall x[P(x): \neg Q(x)]
(k)
(I-I)
        \{\exists-intro on (k) and (I-I)\}
(I) \exists x [P(x) : Q(x)]
```

 $\neg \ \forall x [P(x): \neg Q(x)] \stackrel{\text{val}}{\vDash}$ $\exists x [P(x): Q(x)]$

and ¬-intro

3 elimination

How do we use an existential quantification in a proof?

3-elimination

(k) $\exists x [P(x) : Q(x)]$

|| ||

(I) $\forall x[P(x): \neg Q(x)]$

|| || {∃-elim on (k) and (l)}

(m) F

(k < m, l < m)

 $\exists x [P(x) : Q(x)] \stackrel{\text{val}}{\vDash} \\ \neg \ \forall x [P(x) : \neg Q(x)]$

and ¬- elimination

time for an example!

Proofs with 3-introduction and 3-elimination are unnecessarily long and cumbersome...

There are alternatives!

Alternative 3 elimination

How do we use an existential quantification in a proof?

we pick a witness

(k) $\exists x [P(x) : Q(x)]$

 $\{\exists *-elim on (k)\}$

(m) Pick x with P(x) and Q(x)

x must be new!

time for an example!

(k < m)

 \exists
